Description & Purpose

What – productivity application for bar managers and bartenders to easily manage inventory, generate pricing models, and find drink recipes instantly

Why – The current method of manual inventory and ordering has shown to be inefficient and frustrating. Our application utilizes an algorithm to simplify the ordering process – while also being able to generate recipes based upon the bar’s inventory

Design

Ethical & Intellectual Property Issues

Intellectual Property – The brand names of drinks are not our intellectual property – as such we’ve added generic product names (i.e “well vodka” vs “Smirnoff”). The names are not our IP and will not be marketed as such. However, the app users will have full flexibility in changing names in the inventory to their convenience.

Ethical Property – The recipes stored should account for the fact that drinks can not be “too strong”. All recipes added can be modified with the amount of alcohol content – however it is in the discretion of the customer and bartender to how much is consumed.
