

SwapStream (Team No. 5)

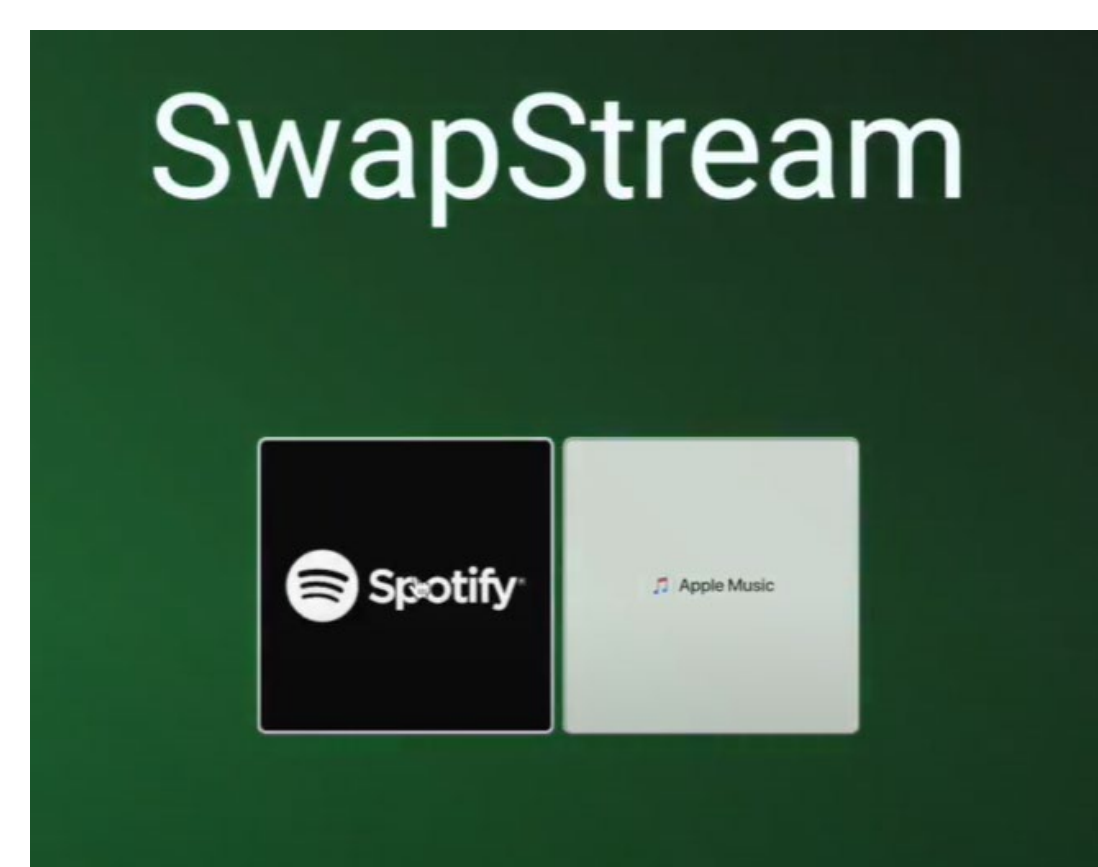

Suhaib Ansari (CS), Joshua Berkley (CS), Sean Cunningham (CS), Jasmine Glaze (CS), Logan Michels (CS)

Description & Purpose

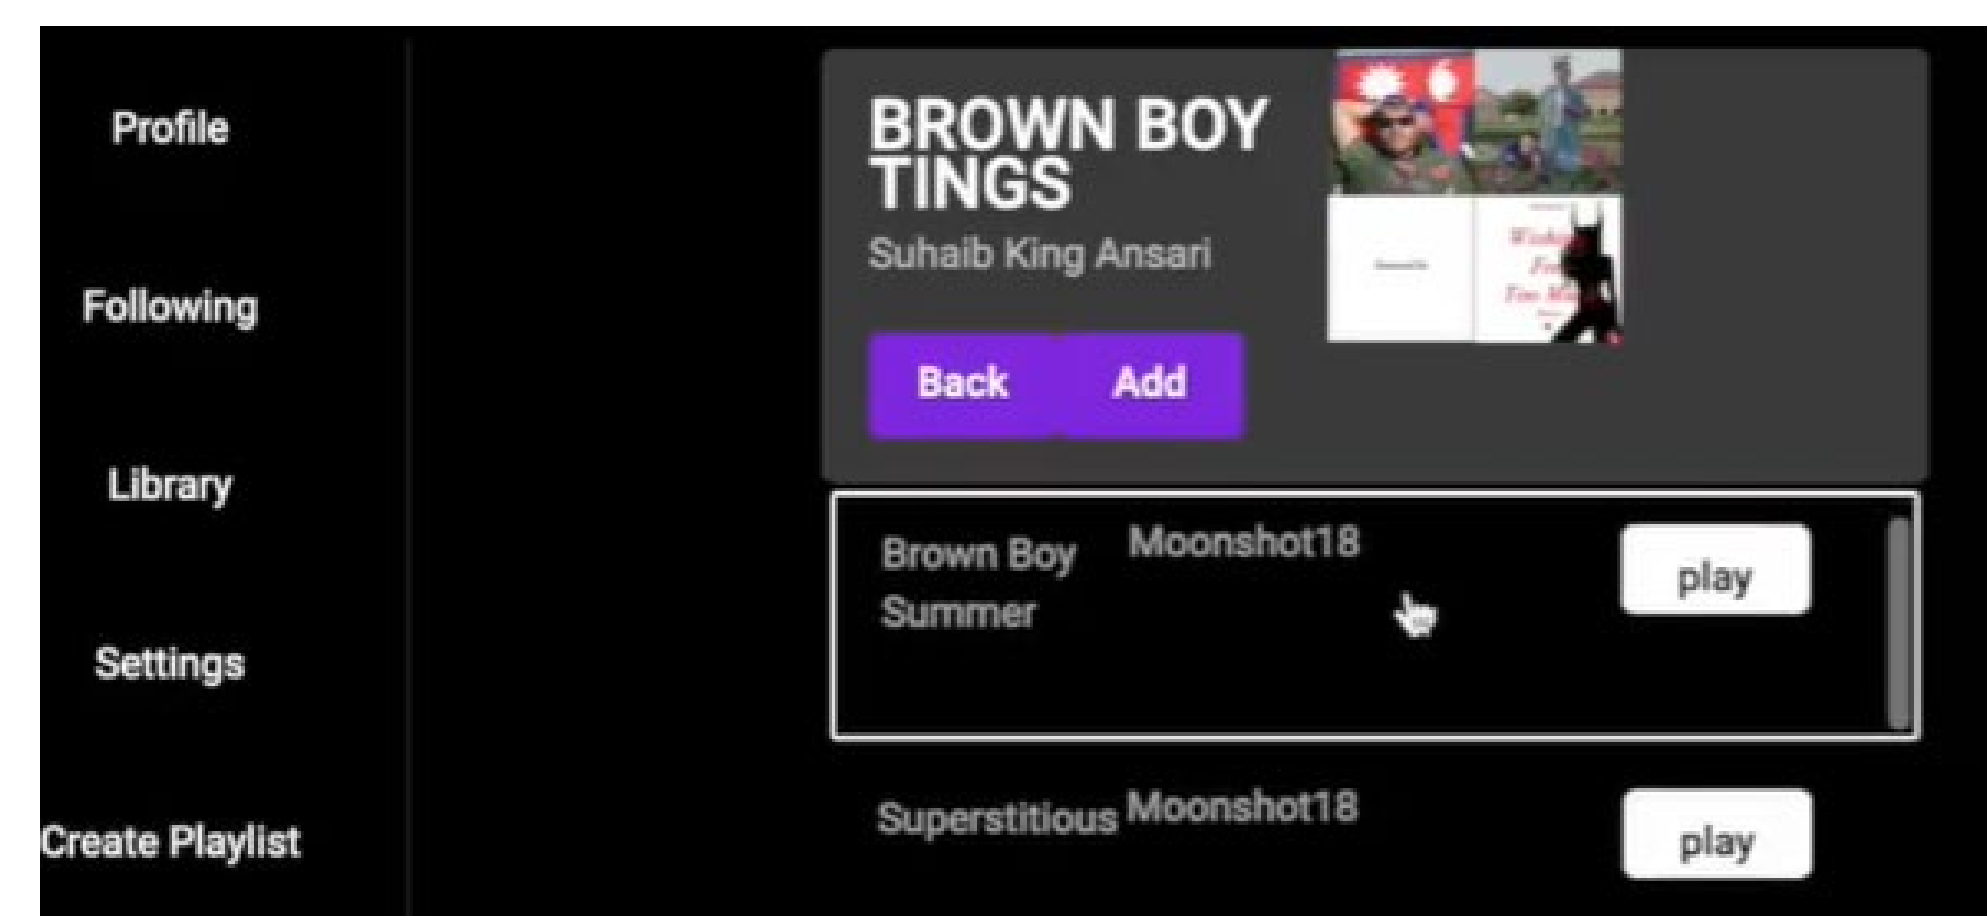

- For our project we created a web application that seamlessly integrates various music streaming platforms
- We decided to tackle this problem to give the user the ability to access all songs on one platform
- The main goal of this project is to integrate the music people listen to into one space
- Our project results in solving the problem of having to utilize multiple streaming sites and allows users to listen to their music in a faster and more streamlined manner

Design

Users will first be met with an entry page that blends Apple Music's UI with Spotify's color scheme

Users can access their own pre-existing playlists as well as playlists created by others

Users also can create their own new playlists and share them with others

Ethical & Intellectual Property Issues

- To resolve possible ethical issues, we made sure to respect the work required to produce new ideas such as this and made sure to take the time to give credit to the original streaming platforms that we combined (Spotify and Apple Music)
- To resolve possible intellectual property issues, we were careful with how similar our platform was to others and created our own code rather than using other platform's source code
