Description & Purpose

Toucan is an events and live chat application that simplifies how users interact anonymously while attending events. Other applications only solve part of the problem with communication at events. Toucan aims to be a more efficient means of connecting with others and finding events that might interest you.

Concept

Ethical & Intellectual Property Issues

The only sensitive information that Toucan stores is the user's location and email address. Users are only identifiable by the anonymous username that is generated to ensure that privacy is kept. Our code is built using open source components, however since Toucan collects sensitive user data we have no plans to open source the app.
